Universal Measuring Probe

Small Universal Measuring Probe

xyLv TΔuvLv RGB u'v'Lv XYZ

Select the probe among the following four types.

For LCD flicker measurement, use the LCD Flicker Measuring Probe or Small LCD Flicker Measuring Probe (see other side).

■ Universal Measuring Probe (Measurement area ϕ27mm / Cable length: 2m)	**CA-PU12**
■ Universal Measuring Probe (Measurement area ϕ27mm / Cable length: 5m)	**CA-PU15**
■ Small Universal Measuring Probe (Measurement area ϕ10mm / Cable length: 2m)	**CA-PSU12**
■ Small Universal Measuring Probe (Measurement area ϕ10mm / Cable length: 5m)	**CA-PSU15**

Up to five probes can be connected to a single main body. Universal Measuring Probes, Small Universal Measuring Probes, LCD Flicker Measuring Probes and Small LCD Flicker Measuring Probes can be connected simultaneously to a single main body.
(To connect multiple probes, the optional four-point extension board (CA-B14) is necessary.)

Photo shows Universal Measuring Probe

Applications

Rear Projector, PDP, LCD, OLED, FED
Chromaticity Inspection / Adjustment
Quality Control of Chromaticity.
White-Balance Inspection / Adjustment
Gamma Inspection / Adjustment.
Contrast Inspection / Adjustment

FASTER

- The luminance and chromaticity of display can be measured as fast as 20 times per second (maximum), enabling faster Gamma measurement.

ACCURATE

- Accuracy of ±0.002 for White, ±0.004 for R,G,B. (Chromaticity)
- CIE 1931 Standard Observer XYZ Filter.
- Matrix measurement enables high accuracy for not just white, but for monochrome colors as well.

LOW LUMINANCE

- Precise measurement can be obtained at low luminance, enabling lower luminance and high-accuracy contrast measurement.

  Range of luminance for chromaticity measurement
  : 0.1 to 1000cd/m^2 (Universal Measuring Probe)
  0.3 to 1000cd/m^2 (Small Universal Measuring Probe)

EASY TO USE

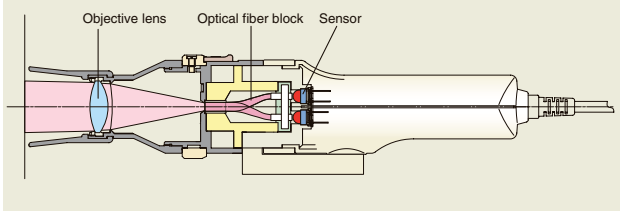
- The measurement position can be easily confirmed by pointing function.
- Short measuring distance of 30mm enables compact measuring system.
- Precise measurement can be obtained without the influence of the outside light by short measuring distance and the rubber hood (standard accessory).
- Special optical design limits acceptance within narrow angle of aperture. It eliminates the influence of viewing. Acceptance angle: ±2.5° (Universal Measuring Probe) , ±5° (Small Universal Measuring Probe)
- 4-digit display for chromaticity enables more precise data readings.
- Expandable up to 5 measuring probes. (Requires expansion board CA-B14)
- USB connection provided as standard, so it can be connected even to computers without serial ports.

Optical System Features

The CA-210 uses a special optical system suitable for providing measurements of LCD panels.

The main components of the optical system are the objective lens, optical fiber block, on-chip lenses, and sensor. The light from the light source is focused onto the receiving window of the optical fiber block. The focused light is mixed inside the optical fiber block and split into 3 parts, which are then guided to the receiving areas of the x, y, z sensors. Here, the light is further focused by the on-chip lenses onto the sensors themselves.

CA-210 optical system

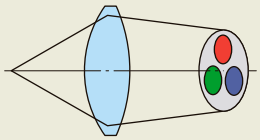


Low-Luminance Measurement

A key point in making it possible to accurately take measurements at low-luminance levels is to minimize the light loss in guiding the received light to the sensors.

In a conventional system, the received light passes through the objective lens and is focused immediately on the 3 sensors (x, y, z sensors). A problem with this method is that some of the light is focused on areas other than the sensor, so the light loss is large.
The CA-210 uses optical fibers, so the light loss due to transmission of the light to the sensors is relatively low compared to conventional methods. Specifically, the light received by the lens is focused on the optical fiber block receiving window. The light then passes through optical fibers directly to on-chip lenses, which focus the light onto the sensors. As a result of this, light transmission loss is eliminated and measurements at low luminance levels are made possible.

Optical system of conventional measuring instruments



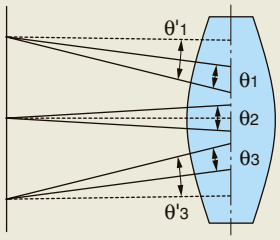
Narrow Viewing Angle/Uniform Viewing Angle

When a person looks at a display, they view the emitted light within a relatively narrow angle. Because of this, in order to obtain measured values which correspond well with the luminance and chromaticity perceived by a person, it is necessary for the measuring instrument to have the same narrow viewing angle. In addition, since LCDs have viewing-angle characteristics, measurements at different viewing angles will result in different measured values. IEC 61747-6, which defines the measurement method for LCDs, specifies that the viewing angle of the measuring instrument for evaluating LCDs should be within 5°. (The viewing angle is shown by θ_1, θ_2, θ_3 and ψ_1, ψ_2, ψ_3.)

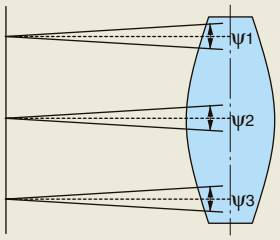
The CA-210 has a viewing angle of 5°, and so meets the requirements of the IEC standard.
For a conventional measuring instrument, when the measuring head has been set so that the measurement axis is perpendicular to the surface of the emitting surface of the measurement subject, differences in the measurement position do not result in great differences in the viewing angle itself (shown as θ_1, θ_2, θ_3 in the figure), but if we look at the incident angle relative to the normal to the emitting surface (shown as a dotted line in the figure), we see that the maximum angles (shown as θ'_1 and θ'_3 in the diagram) are very different. At the edges of the measurement area, light from far outside the viewing angle is received.

By using a special optical system in the CA-210, the angle of the received light is symmetrical about the normal to the emitting surface for every point within the measuring area (ϕ27mm). Since the viewing angle of the CA-210 is 5°, the light received would be only the light within ±2. 5° relative to the normal to the emitting surface (shown as a dotted line in the figure).

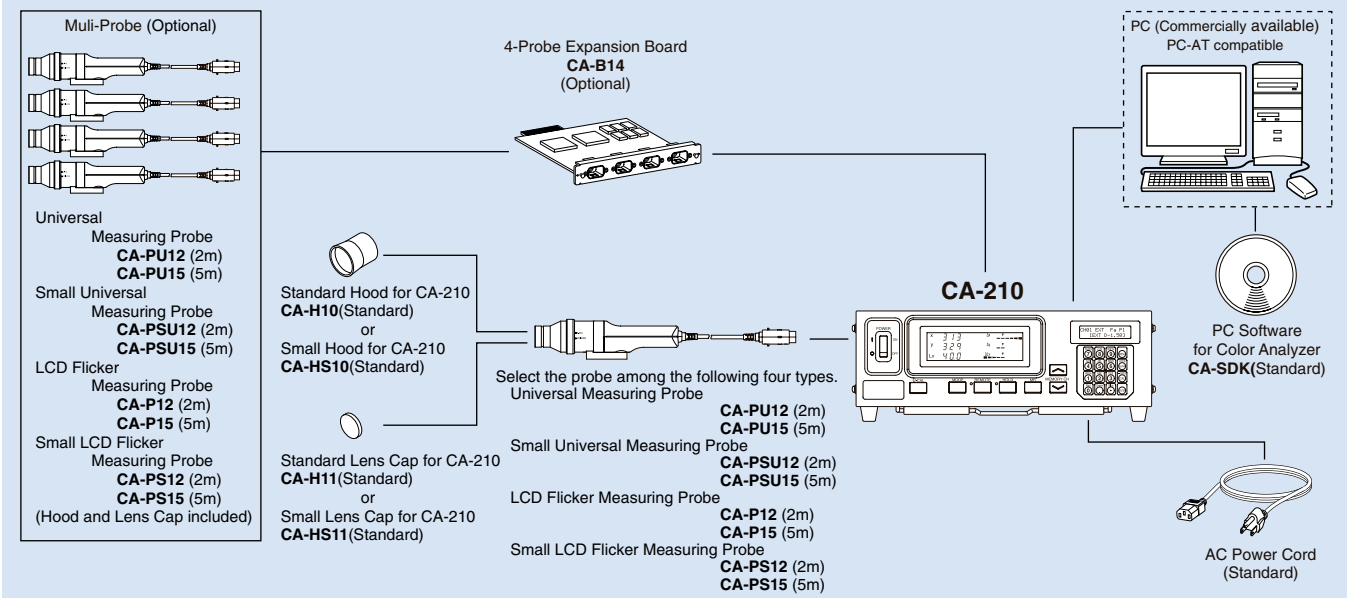
Measurement position and incident angle of conventional instrument



Measurement position and incident angle of CA-210



System Diagram



Non-contact measurement of color and flicker for active-drive LCDs.

LCD Flicker Measuring Probe is applied to the “Flicker measuring function". Because of this it is not able to measure the display whose emission intensity fluctuates in single frame scanning period.

CA-210

LCD Flicker Measuring Probe

Small LCD Flicker Measuring Probe

Same model as CA-210
measuring probes sold until May 2003.

xyLv TΔuvLv RGB u'v'Lv XYZ FLIC.

Select the probe among the following four types.

- ■ LCD Flicker Measuring Probe **CA-P12**
  (Measurement area ϕ27mm / Cable length: 2m)
- ■ LCD Flicker Measuring Probe **CA-P15**
  (Measurement area ϕ27mm / Cable length: 5m)
- ■ Small LCD Flicker Measuring Probe **CA-PS12**
  (Measurement area ϕ10mm / Cable length: 2m)
- ■ Small LCD Flicker Measuring Probe **CA-PS15**
  (Measurement area ϕ10mm / Cable length: 5m)

Up to five probes can be connected to a single main body. Universal Measuring Probes, Small Universal Measuring Probes, LCD Flicker Measuring Probes and Small LCD Flicker Measuring Probes can be connected simultaneously to a single main body.
(To connect multiple probes, the optional four-point extension board (CA-B14) is necessary.)

A basic model with CA-100 compatible mode for contact measurements of the color of various types of displays, as CRTs, PDPs.

CRT COLOR ANALYZER

CA-100Plus

Measuring Probe

High luminance Measuring Probe

Please request a CA-100Plus catalog for further information.

xyLv TΔuvLv RGB u'v'Lv XYZ

Select the probe among the following four types.

- ■ Measuring Probe **CA-P02**
  (Cable length: 2m)
- ■ Measuring Probe **CA-P05**
  (Cable length: 5m)
- ■ High luminance Measuring Probe **CA-PH02**
  (Cable length: 2m)
- ■ High luminance Measuring Probe **CA-PH05**
  (Cable length: 5m)

Up to five probes can be connected to a single main body. Measuring Probes and High luminance Measuring Probes can be connected simultaneously to a single main body.
(To connect multiple probes, the optional four-point extension board (CA-B04) is necessary.)

Applicability of CA series for different display types

This table is based on the most popular method for controlling emission intensity for each display type.

(*1) Measurements of displays using certain control methods are not possible. For details of measurement compatibility, contact your nearest Minolta representative. Examples for which measurement is not possible:
- Displays which use PWM, etc. for control of emission intensity.
- Displays with backlights which emit intermittently.
- Displays which write black for each frame,

etc.

(*2) Although the CA-100Plus can handle the emission intensity variation, the instrument has a wide acceptance angle which makes it unsuitable for measurements of LCDs with strong viewing-angle dependency.

○ Recommended
△ Measurement possible with restrictions, but probes marked with ○ are recommended
× Measurement not possible

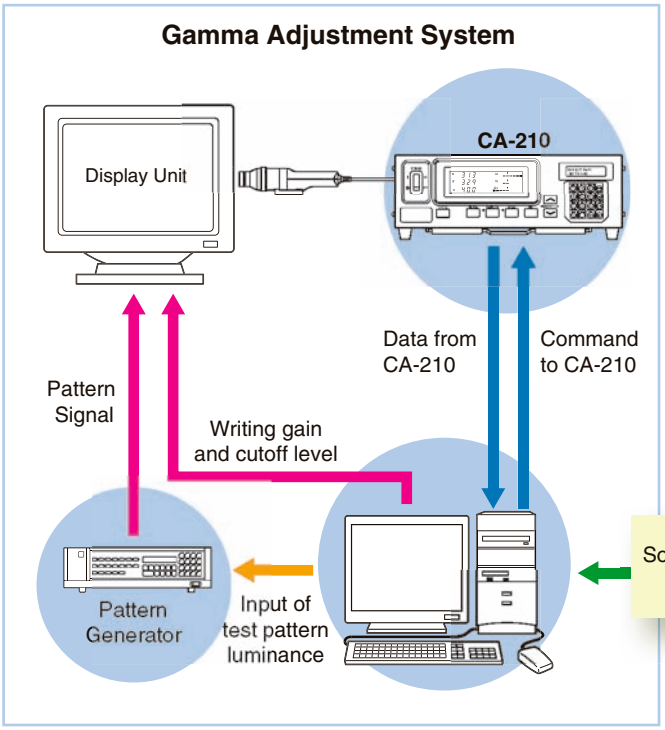
LCD Flicker Measuring Probe and Small LCD Flicker Measuring Probe are unsuitable for Measurements of CRTs.

Construction of Gamma Adjustment System

This is an example of gamma adjustment system. User can create adjustment system by PC Software for Color Analyzer CA-SDK which comes as standard accessory. Software controls CA-210 and pattern generator to obtain color and chromaticity data with each out put level. After calculating correction factor of gamma curve, software will write the look up table of coefficient to monitor firmware.

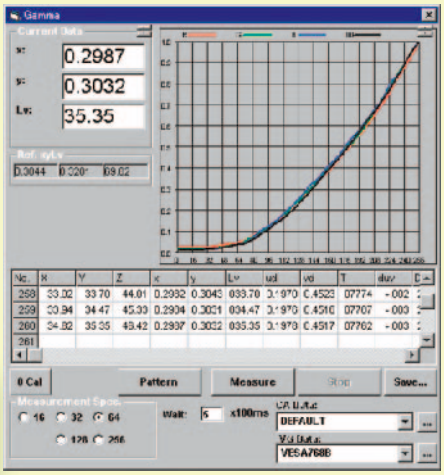
The white balance adjustment system can be constructed by a similar method.



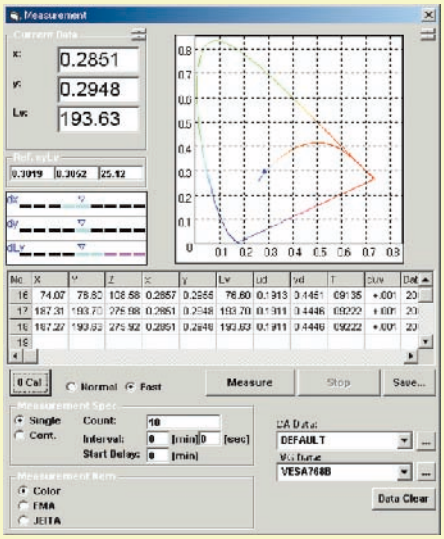
Matrix Calibration

User's own matrix correction factor is set to the memory channels by measuring three monochrome colors (R, G, B and W) of known values and setting the obtained calibration values (xyLv) and emission characteristic to the instrument. Once this factor is set,a the measured values will be displayed after correction by this factor and output each time measurement is taken.

Performing matrix calibration enables high-accuracy measurements of displays that provide colors through additive color mixing of three monochrome colors (R, G and B). Since the matrix correction factor obtained from Minolta's calibration standard has been set, measured values calculated based on this factor will be acquired when this instrument is used for the first time since shipment from the factory.



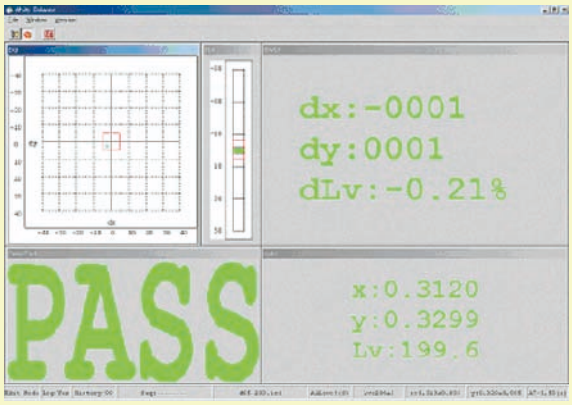
Sample software Gamma



Sample software Color

PC Software for Color Analyzer CA-SDK (Standard accessory)

Standard accessory SDK helps create software easily according to needs.
Sample software is bundled; you can start data collection easily.



Example of White Balance Adjustment Software made by SDK

Required system
OS : Windows® 98,2000,ME,XP

Windows® and Excel® are a trademark of Microsoft Corporation in the USA and other countries.

Sample software (Standard)

Cal
CA-210 can be corrected in the matrix calibration method using Konica Minolta's spectroradiometer CS-1000A.

Color
The measurement data of CA-210 can be acquired into the PC. Drift tests, LCD stability test and so on can be performed easily. The acquired data can be read with Excel® or other spreadsheet software.

Contrast
Multi-point measurement (5, 9, or 25 points) can be made for white uniformity and contrast measurement.

Gamma
R, G, B, and W gamma measurements for gradations of 16, 32, 64, 128, and 256 steps.

SAFETY PRECAUTIONS

To ensure correct use of the instrument, please adhere to the following.

- Before using the instrument, be sure to read the instruction manual.
- Always use the specified power. Use of inappropriate power may result in afire or electric shock.

ISO 9001 CERTIFIED

The manufacturing center of Konica Minolta Sensing Inc. (Location: Aichi Pref., Japan) was approved by the British certification organization Lloyd's Register Quality Assurance for certification under the ISO 9001: 1994 international quality management system standards on March 3, 1995. Since its establishment in 1990, the center has carried out the development and production of precision instruments and associated application software for the measurement of color, light, and shape.
Certification was awarded to the center's quality management system, including design, manufacturer, management of manufacture, calibration and servicing.Certification was carried over to the ISO 9001: 2000 standards in February, 2003.
